<center>Module 4, 3-2-1</center>

Learned

1. How to make functions in R.
2. How to write conditionals in R.
3. How to write loops in R.

Interesting

1. The stopifnot function is something I haven't seen in other programming languages and it is very useful. It really condenses the amount of conditionals needed to check parameters.
2. Repeat loops may exist in other languages, but I haven't seen them before; a loop that only stops with a break.

Questions

1. When would it be best to use a repeat loop?
